Course Name: SOFTWARE ENGINEERING
Course Faculty: Dr. Latha

Slot: B

Project Title: AI-Powered Smart Court Case Management and Judicial Analytics Platform

Module Photographs:

Project Description:

The **AI-Powered Smart Court Case Management and Judicial Analytics Platform** is an intelligent digital system designed to improve the efficiency, transparency, and speed of court case management. Traditional court systems often face challenges such as large numbers of pending cases, manual document processing, difficulty in tracking case progress, scheduling conflicts, and delays in judicial decision-making. This proposed platform uses **Artificial Intelligence (AI)**, **Machine Learning (ML)**, **Natural Language Processing (NLP)**, **Data Analytics**, and **Cloud Technologies** to support the management and analysis of judicial cases. The system can digitally store and organize case records, automatically classify legal documents, track case progress, schedule hearings, identify case delays, and provide analytical insights to judicial administrators.

Individual Contribution: I was responsible for designing and developing the user interface of the Smart Court platform. I created the dashboard, case management pages, registration forms, and navigation components. I developed an interactive and responsive interface to provide a user-friendly experience. I also ensured that different users could easily access and use their respective system features.
